### **Abstract**

The ozone therapy in russia as well as in neighbour countries is manifold: local and rectal applications, small and large ozone and autohemotherapy as well as to a great extent ozone salt solutions for infusion. As the production of ozone salt-solution is relatively cheap and easy to handle, extensive experience has been gained with this remedy since many years, e. g. in the fields of disturbed circulation, infections, wound surgery, war injuries, different forms of hepatitis, pregnancy, abdominal surgery as well as chronical infections in otorhinolaryngology. On the basis of our experience with large number of patients in dermatological and venereological unit of a hospital in Nishny Nowgorod we report about the therapeutical success with saline infusions and local applications.
